## Section 1.6 = Relations and Functions

A relation is a pairing of input values with output values. It can be shown as a set of ordered pairs  $(x, y)$  where  $x$  is an input and  $y$  is an output.

The set of input values for a relation is called the domain, and the set of output values is called the range.

$$(x, y) \rightarrow (\text{input}, \text{output}) \rightarrow (\text{domain}, \text{range})$$

| Mapping Diagram | Set of Order Pairs             |
|-----------------|--------------------------------|
|                 | $\{(2, -1), (2, 5), (2, 11)\}$ |

Example 1: Give the domain and range for each relation.

a.  $\{(2, 3), (4, -1), (-6, 0), (-8, -2)\}$

Domain:

$\{-8, -6, 2, 4\}$

Range:

$\{-2, -1, 0, 3\}$

b.

| First-Class Stamp Rates |      |      |      |      |      |      |
|-------------------------|------|------|------|------|------|------|
| Year                    | 1900 | 1920 | 1940 | 1960 | 1980 | 2000 |
| Rate (cents)            | 2    | 2    | 3    | 4    | 15   | 33   |

Domain:  $\{1900, 1920, 1940, 1960, 1980, 2000\}$

Range:  $\{2, 2, 3, 4, 15, 33\}$

A relation in which the first coordinate is NEVER repeated is called a function.

In a function, there is only one output for each input, so each element of the domain is mapped to exactly one element in the range.

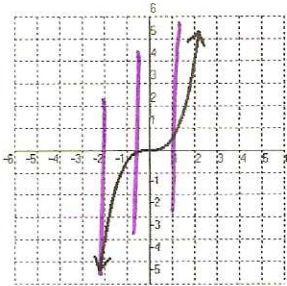

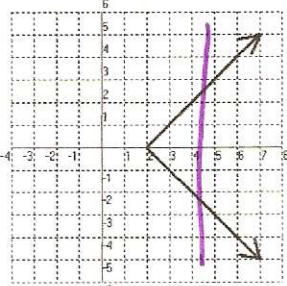

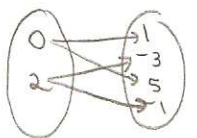

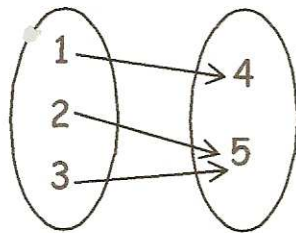

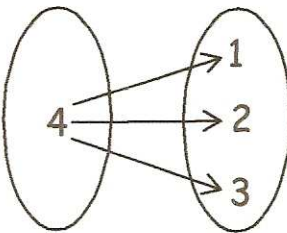

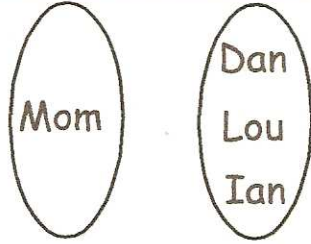

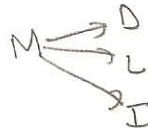

**IMPORTANT:** Although a single input in a function cannot be mapped to more than one output, two or more different inputs can be mapped to the same output.

Every point on a vertical line has the same x-coordinate, so a vertical line CANNOT represent a function. If a vertical line passes through more than one point on the graph of a relation, the relation must have more than one point with the same x-coordinate. Therefore the relation is NOT a function.

To summarize, a function is a relation where each element in the domain has only ONE corresponding element in the range, or

- given the order pairs, the x's do not repeat
- the graph passes the vertical line test
- given the mapping, each domain goes to a different element of the range

Example 2: Are the following functions? WHY or WHY NOT?

|  |  |    |    |    |   |   |   |   |   |   |   |   |   |
|--|--|----|----|----|---|---|---|---|---|---|---|---|---|
| <p>a.</p>  <p><b>YES</b><br/>passes VLT</p>   | <p>b.</p>  <p><b>NO</b><br/>fails VLT</p>  |    |    |    |   |   |   |   |   |   |   |   |   |
| <p>c. <math>\{(0,1), (2,-3), (0,5), (2,-1)\}</math></p>  <p><b>NO</b><br/>x-values repeat</p> | <p>d.</p> <table border="1" data-bbox="803 735 1453 829"> <tr> <td>x</td> <td>-2</td> <td>-1</td> <td>0</td> <td>1</td> <td>2</td> </tr> <tr> <td>y</td> <td>4</td> <td>1</td> <td>0</td> <td>1</td> <td>4</td> </tr> </table> <p><b>YES</b><br/>x-values do NOT repeat<br/><i>*remember, it is OK for y-values to repeat</i></p>  | x  | -2 | -1 | 0 | 1 | 2 | y | 4 | 1 | 0 | 1 | 4 |
| x  | -2   | -1 | 0  | 1  | 2 |   |   |   |   |   |   |   |   |
| y  | 4  | 1  | 0  | 1  | 4 |   |   |   |   |   |   |   |   |
| <p>e.</p>  <p><b>YES</b><br/>each x-value assigned to only one y-value</p>                  | <p>f.</p>  <p><b>NO</b><br/>domain value of 4 is assigned to more than 1 range value</p>   |    |    |    |   |   |   |   |   |   |   |   |   |
|   | <p>g. Is it a function if mom is the domain? Why or why not?</p>  <p><b>NO</b><br/>domain value assigned to more than one range value</p> <p>h. Is it a function if the sons are the domain? Why or why not?</p>  <p><b>YES</b><br/>each domain value assigned to only one range value</p> |    |    |    |   |   |   |   |   |   |   |   |   |
| <p>Last names and social security numbers</p>  | <p>i. Is it a function if the last names are the domain? Why or why not?</p> <p><b>NO</b><br/>more than one "Smith", so would be assigned to many different SSNs.</p> <p>j. Is it a function if the social security numbers are the domain? Why or why not?</p> <p><b>YES</b><br/>SSN are unique and assigned to only one individual</p>   |    |    |    |   |   |   |   |   |   |   |   |   |
